

COMP30820
Java Programming (Conv)

Michael O'Mahony

Chapter 5 Loops

Objectives

- To write programs for executing statements repeatedly using a `while` loop (§5.2).
- To control a loop with a sentinel value (§5.2.4).
- To write loops using `do-while` statements (§5.3).
- To write loops using `for` statements (§5.4).
- To discover the similarities and differences of three types of loop statements (§5.5).
- To write nested loops (§5.6).
- To implement program control with `break` and `continue` (§5.9).

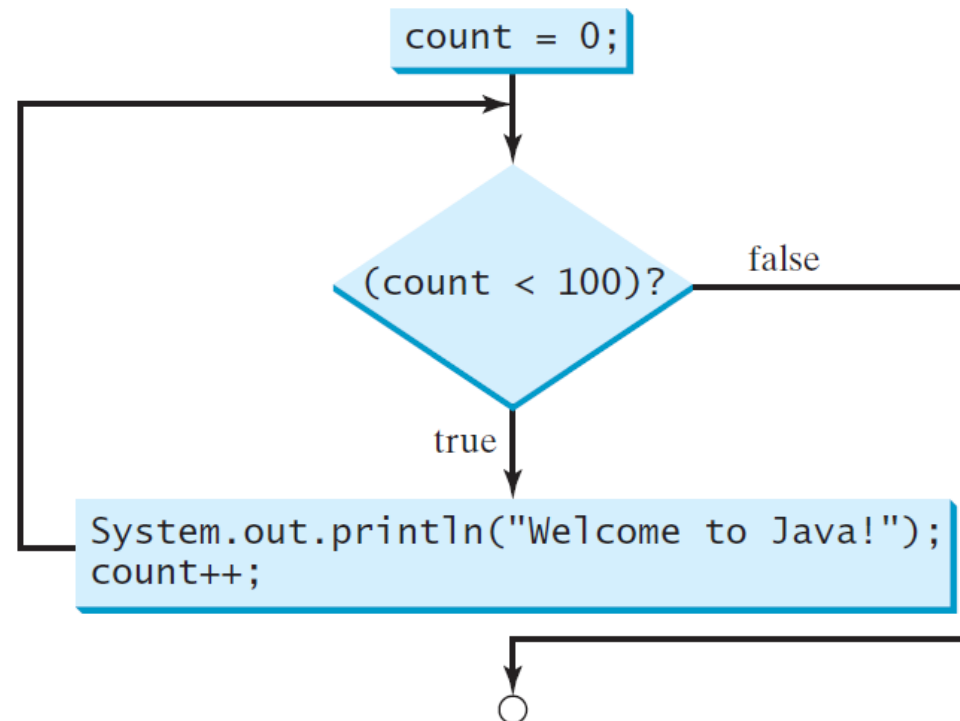

while Loop Flow Chart

```
while (loop-continuation-condition) {  
    // loop-body  
    Statement(s);  
}
```

while Loop Flow Chart

```
int count = 0;  
while (count < 100) {  
    System.out.println("Welcome to Java!");  
    count++;  
}
```

Trace while Loop

```
int count = 0;
while (count < 2) {
    System.out.println("Welcome to Java!");
    count++;
}
```

Trace while Loop

```
int count = 0;
```

Initialize count

```
while (count < 2) {
```

```
    System.out.println("Welcome to Java!");
```

```
    count++;
```

```
}
```

Trace while Loop, cont.

```
int count = 0;
```

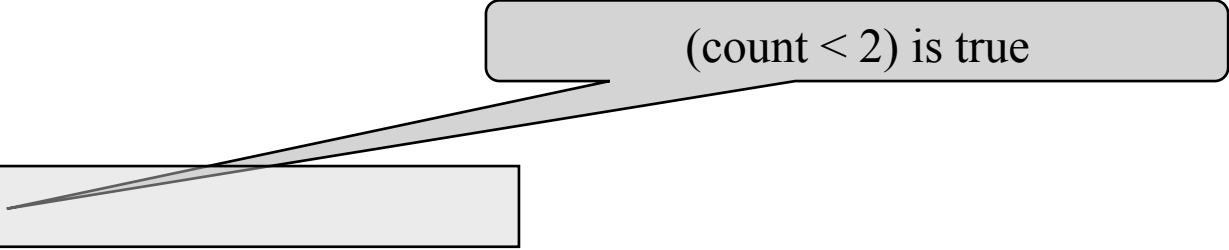

```
while (count < 2) {
```

```
    System.out.println("Welcome to Java!");
```

```
    count++;
```

```
}
```

(count < 2) is true

A diagram illustrating the execution of a while loop. A light gray rectangular box highlights the condition 'while (count < 2) {'. A line extends from the right side of this box, pointing to a separate light gray rectangular box containing the text '(count < 2) is true'. This visualizes the state where the loop condition is being evaluated and found to be true, allowing the loop body to execute.

Trace while Loop, cont.

```
int count = 0;
```

```
while (count < 2) {
```

```
    System.out.println("Welcome to Java!");
```

```
    count++;
```

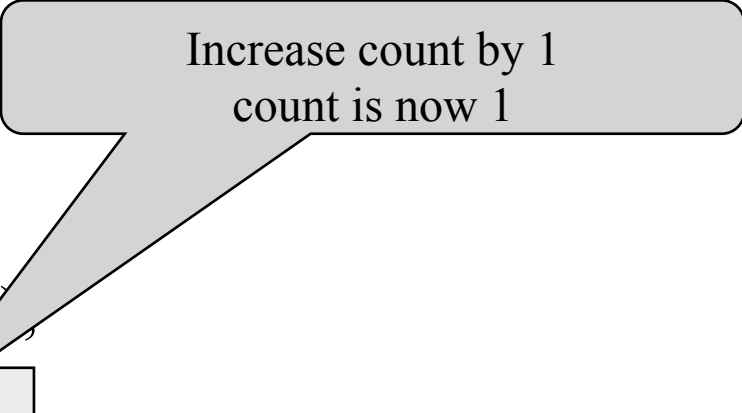

```
}
```

Print Welcome to Java

Trace while Loop, cont.

```
int count = 0;  
while (count < 2) {  
    System.out.println("Welcome to Java!");  
    count++;  
}
```

Increase count by 1
count is now 1

Trace while Loop, cont.

```
int count = 0;
```

```
while (count < 2) {
```

```
    System.out.println("Welcome to Java!");
```

```
    count++;
```

```
}
```

(count < 2) is still true since count
is 1

Trace while Loop, cont.

```
int count = 0;
```

```
while (count < 2) {
```

```
    System.out.println("Welcome to Java!");
```

```
    count++;
```

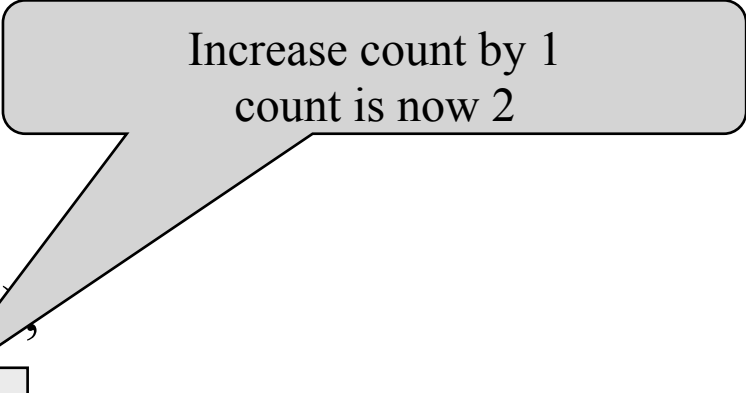

```
}
```

Print Welcome to Java

Trace while Loop, cont.

```
int count = 0;  
while (count < 2) {  
    System.out.println("Welcome to Java!");  
    count++;  
}
```

Increase count by 1
count is now 2

Trace while Loop, cont.

```
int count = 0;
```

```
while (count < 2) {
```

```
    System.out.println("Welcome to Java!");
```

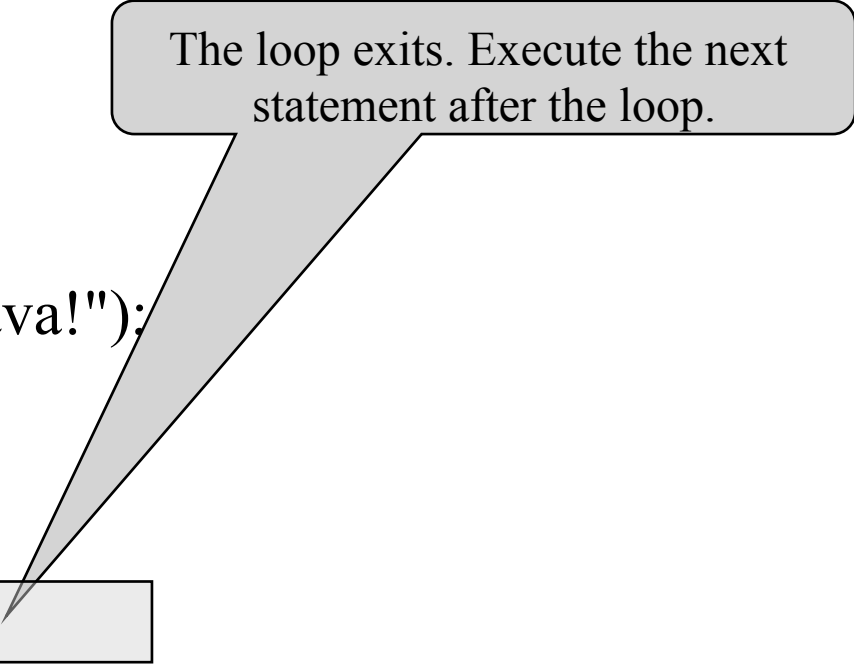

```
    count++;
```

```
}
```

(count < 2) is false since count is 2
now

Trace while Loop

```
int count = 0;  
while (count < 2) {  
    System.out.println("Welcome to Java!");  
    count++;  
}
```

The loop exits. Execute the next statement after the loop.

Ending a Loop with a Sentinel Value

Often the number of times a loop is executed is not predetermined.

You can use an input value to signal the end of the loop. Such a value is known as a *sentinel value*.

Example – write a program that reads and calculates the sum of an unspecified number of integers. The input 0 signifies the end of the input.

SentinelValue

Caution

Do not use floating-point values for equality checking in a loop control.

Since floating-point values are approximations, using them for equality checking can result in problems...

Consider the following code for computing: $1 + 0.9 + 0.8 + \dots + 0.1$

```
double sum = 0;
double num = 1;
while (num != 0) {
    sum += num;
    num -= 0.1;
}
System.out.println(sum);
```

Caution

Do not use floating-point values for equality checking in a loop control.

Since floating-point values are approximations, using them for equality checking can result in problems...

Consider the following code for computing: $1 + 0.9 + 0.8 + \dots + 0.1$

```
double sum = 0;
double num = 1;
while (num != 0) {
    sum += num;
    num -= 0.1;
}
System.out.println(sum);
```

No guarantee num will ever be 0 – infinite loop

Use: `while (num > 0)`

do-while Loop

A do-while loop is the same as a while loop except that it executes the loop body first and then checks the loop-continuation-condition (aka test).

```
do {  
    // Loop body  
    Statement(s);  
} while (loop-continuation-condition);
```

while vs. do-while Loops

Flow Charts

while loop

do-while loop

Problem: Repeat Addition Until Correct

Write a program that prompts the user to add two single digits. Using a loop, let the user repeatedly enter an answer until it is correct.

Compare solutions using:

- (1) `while` loop
- (2) `do-while` loop
- (3) `do-while` loop and the `break` keyword

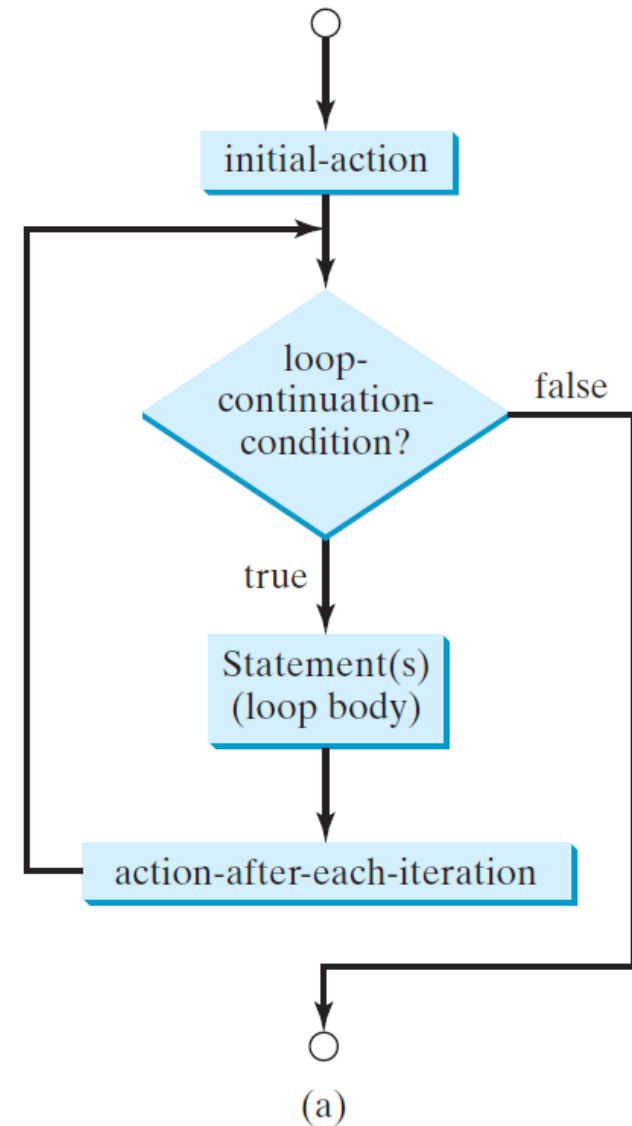

[RepeatAdditionQuiz1](#)

[RepeatAdditionQuiz2](#)

[RepeatAdditionQuiz3](#)

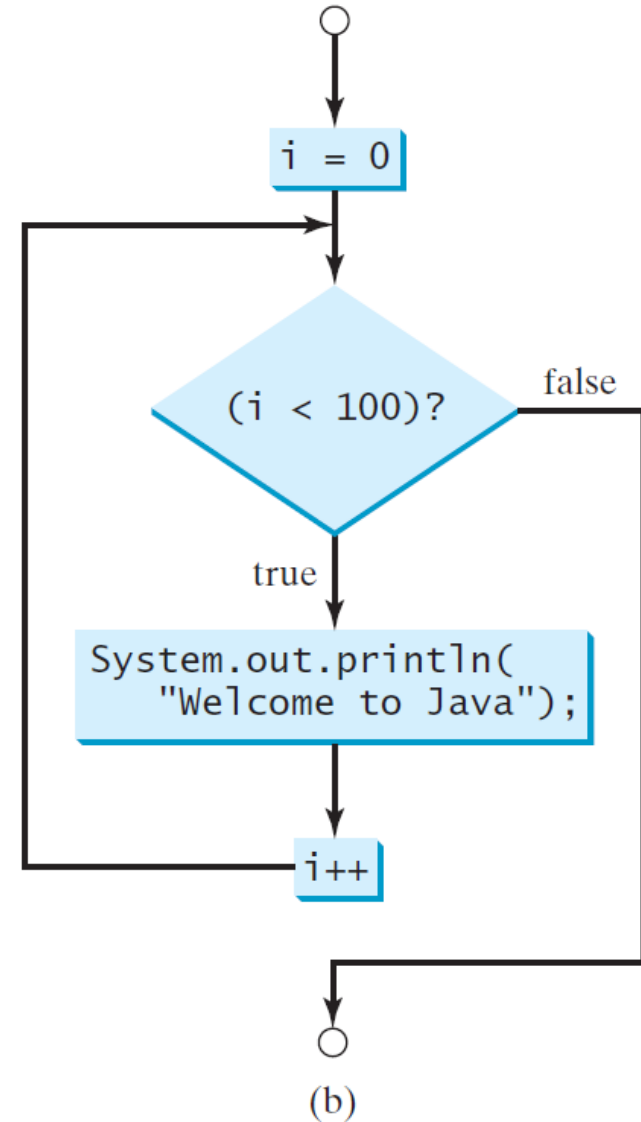

for Loops

```
for (initial-action;  
     loop-continuation-condition;  
     action-after-each-iteration) {  
    // loop body;  
    Statement(s);  
}
```

for Loops

```
int i;  
for (i = 0; i < 100; i++) {  
    System.out.println("Welcome  
        to Java!");  
}
```

Trace for Loop

```
int i;  
for (i = 0; i < 2; i++) {  
    System.out.println("Welcome to Java!");  
}
```

animation

Trace for Loop

int i;

Declare i

```
for (i = 0; i < 2; i++) {  
    System.out.println("Welcome to Java!");  
}
```

Trace for Loop, cont.

```
int i;  
for (i = 0; i < 2; i++) {  
    System.out.println("Welcome to Java!");  
}
```

Initial-action:
i is now 0

Trace for Loop, cont.

```
int i;  
for (i = 0; i < 2; i++) {  
    System.out.println("Welcome to Java!");  
}
```

(i < 2) is true
since i is 0

animation

Trace for Loop, cont.

```
int i;  
for (i = 0; i < 2; i++) {  
    System.out.println("Welcome to Java!");  
}
```

Print Welcome to Java

Trace for Loop, cont.

```
int i;  
for (i = 0; i < 2; i++) {  
    System.out.println("Welcome to Java!");  
}
```

Action-after-each-iteration:
i is now 1

Trace for Loop, cont.

```
int i;  
for (i = 0; i < 2; i++) {  
    System.out.println("Welcome to Java!");  
}
```

(i < 2) is still true
since i is 1

animation

Trace for Loop, cont.

```
int i;  
for (i = 0; i < 2; i++) {  
    System.out.println("Welcome to Java!");  
}
```

Print Welcome to Java

Trace for Loop, cont.

```
int i;  
for (i = 0; i < 2; i++) {  
    System.out.println("Welcome to Java!");  
}
```

Action-after-each-iteration:
i is now 2

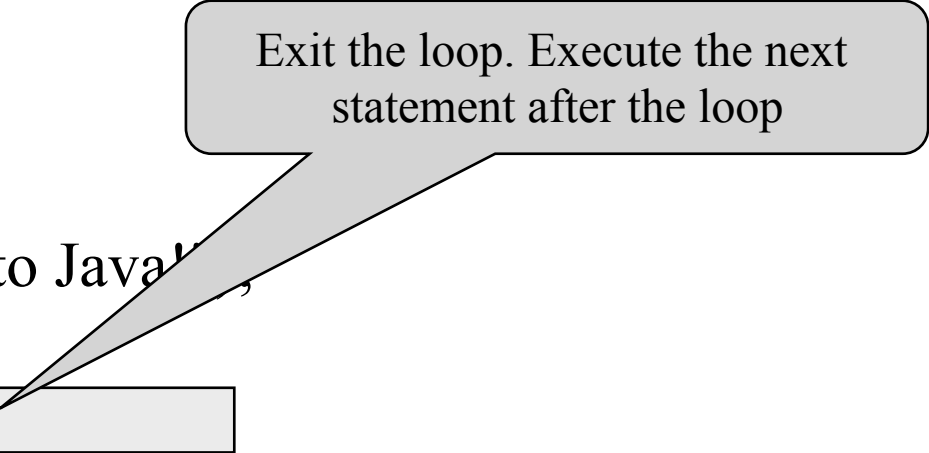

Trace for Loop, cont.

```
int i;  
for (i = 0; i < 2; i++) {  
    System.out.println("Welcome to Java!");  
}
```

(i < 2) is false
since i is 2

Trace for Loop, cont.

```
int i;  
for (i = 0; i < 2; i++) {  
    System.out.println("Welcome to Java");  
}
```

Exit the loop. Execute the next statement after the loop

Note

```
for (initial-action; loop-continuation-condition; action-after-each-iteration) {  
    // loop body;  
    Statement(s);  
}
```

The initial-action in a `for` loop can be a list of zero or more comma-separated expressions.

The action-after-each-iteration in a `for` loop can be a list of zero or more comma-separated statements.

Note

```
for (initial-action; loop-continuation-condition; action-after-each-iteration) {  
    // loop body;  
    Statement(s);  
}
```

The initial-action in a `for` loop can be a list of zero or more comma-separated expressions.

The action-after-each-iteration in a `for` loop can be a list of zero or more comma-separated statements.

Examples:

```
for (int i = 1; i < 10; System.out.println(i++));
```

Note

```
for (initial-action; loop-continuation-condition; action-after-each-iteration) {  
    // loop body;  
    Statement(s);  
}
```

The initial-action in a `for` loop can be a list of zero or more comma-separated expressions.

The action-after-each-iteration in a `for` loop can be a list of zero or more comma-separated statements.

Examples:

```
for (int i = 1; i < 10; System.out.println(i++));  
// prints 1, 2, ..., 9
```

Note

```
for (initial-action; loop-continuation-condition; action-after-each-iteration) {  
    // loop body;  
    Statement(s);  
}
```

The initial-action in a `for` loop can be a list of zero or more comma-separated expressions.

The action-after-each-iteration in a `for` loop can be a list of zero or more comma-separated statements.

Examples:

```
for (int i = 1; i < 10; System.out.println(i++));  
// prints 1, 2, ..., 9
```

```
for (int i = 1; i < 10; System.out.println(++i));
```

Note

```
for (initial-action; loop-continuation-condition; action-after-each-iteration) {  
    // loop body;  
    Statement(s);  
}
```

The initial-action in a `for` loop can be a list of zero or more comma-separated expressions.

The action-after-each-iteration in a `for` loop can be a list of zero or more comma-separated statements.

Examples:

```
for (int i = 1; i < 10; System.out.println(i++));  
// prints 1, 2, ..., 9
```

```
for (int i = 1; i < 10; System.out.println(++i));  
// prints 2, 3, ..., 10
```

Note

```
for (initial-action; loop-continuation-condition; action-after-each-iteration) {  
    // loop body;  
    Statement(s);  
}
```

The initial-action in a `for` loop can be a list of zero or more comma-separated expressions.

The action-after-each-iteration in a `for` loop can be a list of zero or more comma-separated statements.

Examples:

```
for (int i = 1; i < 10; System.out.println(i++));  
// prints 1, 2, ..., 9
```

```
for (int i = 1; i < 10; System.out.println(++i));  
// prints 2, 3, ..., 10
```

```
for (int i = 0, j = 0; i + j < 10; i++, j++)  
    System.out.println(i + " " + j);
```

Note

```
for (initial-action; loop-continuation-condition; action-after-each-iteration) {  
    // loop body;  
    Statement(s);  
}
```

The initial-action in a `for` loop can be a list of zero or more comma-separated expressions.

The action-after-each-iteration in a `for` loop can be a list of zero or more comma-separated statements.

Examples:

```
for (int i = 1; i < 10; System.out.println(i++));  
// prints 1, 2, ..., 9
```

```
for (int i = 1; i < 10; System.out.println(++i));  
// prints 2, 3, ..., 10
```

```
for (int i = 0, j = 0; i + j < 10; i++, j++)  
    System.out.println(i + " " + j);  
// prints 0 0, 1 1, 2 2, 3 3, 4 4
```

Note

If the loop-continuation-condition (aka test) in a `for` loop is omitted, it is implicitly true.

The loop in (a), which is an infinite loop, is correct.

It is better to use the equivalent loop in (b) to avoid confusion.

```
for ( ; ; ) {  
    // Do something  
}
```

(a)

Equivalent

```
while (true) {  
    // Do something  
}
```

(b)

Caution

Adding a semicolon at the end of the `for` clause before the loop body is a common mistake:

```
int i;  
for (i=0; i<10; i++);  
{  
    System.out.println("i is " + i);  
}
```

Logic
Error

Caution

Adding a semicolon at the end of the `for` clause before the loop body is a common mistake:

```
int i;  
for (i=0; i<10; i++);  
{  
    System.out.println("i is " + i);  
}
```

Logic
Error

```
// displays: i is 10
```

Caution, cont.

Similarly, the following `while` loop is also incorrect:

```
int i=0;
while (i < 10);
{
    System.out.println("i is " + i);
    i++;
}
```

Logic error, infinite loop, program will not execute subsequent statements

Caution, cont.

Similarly, the following `while` loop is also incorrect:

```
int i=0;
while (i < 10);
{
    System.out.println("i is " + i);
    i++;
}
```

Logic error, infinite loop, program will not execute subsequent statements

In the case of the `do-while` loop, a semicolon is needed to end the loop:

```
int i=0;
do {
    System.out.println("i is " + i);
    i++;
} while (i < 10);
```

Correct

Which Loop to Use?

The three forms of loop statements, `while`, `do-while`, and `for`, are expressively equivalent; that is, you can write a loop in any of these three forms.

For example, a `while` loop in (a) can always be converted into the `for` loop in (b):

```
while (loop-continuation-condition) {  
    // Loop body  
}
```

(a)

Equivalent

```
for ( ; loop-continuation-condition; )  
    // Loop body  
}
```

(b)

A `for` loop in (a) can generally be converted into the `while` loop in (b), except in certain special cases (more later):

```
for (initial-action;  
     loop-continuation-condition;  
     action-after-each-iteration) {  
    // Loop body;  
}
```

(a)

Equivalent

```
initial-action;  
while (loop-continuation-condition) {  
    // Loop body;  
    action-after-each-iteration;  
}
```

(b)

Which Loop to Use?

Use the loop that is most intuitive. In general:

- `for` loops – when the number of repetitions is known. For example, when you need to iterate over a string, iterate over an array... For example:

```
String str = "We love Java!";  
for (int i = 0; i < str.length(); i++) {  
    char ch = str.charAt(i);  
    System.out.println(ch);  
}
```

- `while` loops – when the number of repetitions is not known. For example, reading numbers from the console until the input is 0.
- `do-while` loops – use instead of `while` loops if the loop body has to be executed before testing the continuation condition.

Example – Looping Over Strings

Write a program to read a line of text from the console and replace (1) every lowercase letter in the input text with its uppercase equivalent and (2) every uppercase letter in the input text with its lowercase equivalent.

ReplaceLetters

Nested Loops

Nested loops consist of an outer loop and one or more inner loops.

Each time the outer loop is repeated, the inner loops are reentered, and started anew.

Problem: Write a program that reads an integer n (where n is the pattern size) from the console and displays the pattern as shown below.

				1				
				1	2			
			1	2				
		1	2	3				
				1	2	3	4	

Example patterns for $n = 3$ (left) and $n = 4$ (right)

DisplayPattern

break and continue

Using the `break` and `continue` keywords in a loop:

- `break` – immediately terminates the loop.
- `continue` – ends the current iteration of the loop and program control goes to the end of the loop body.

for vs. while loops – continue

```
int sum = 0;
for (int i = 0; i < 4; i++) {
    if (i % 3 == 0)
        continue;
    sum += i;
}

System.out.println(sum);
```

`continue` – ends the current iteration of the loop and program control goes to the end of the loop body.

for vs. while loops – continue

```
int sum = 0;
for (int i = 0; i < 4; i++) {
    if (i % 3 == 0)
        continue;
    sum += i;
}

System.out.println(sum);
```

// prints: 3

`continue` – ends the current iteration of the loop and program control goes to the end of the loop body.

for vs. while loops – continue

```
int sum = 0;
for (int i = 0; i < 4; i++) {
    if (i % 3 == 0)
        continue;
    sum += i;
}

System.out.println(sum);
```

// prints: 3

```
int i = 0, sum = 0;
while (i < 4) {
    if (i % 3 == 0)
        continue;
    sum += i;
    i++;
}

System.out.println(sum);
```

// prints: ??

continue – ends the current iteration of the loop and program control goes to the end of the loop body.

for vs. while loops – continue

while (and do-while) loops:

- Immediately after the `continue` statement – the loop-continuation-condition (aka test) is evaluated.

for loop:

- Immediately after the `continue` statement – the action-after-each-iteration is performed, then the loop-continuation-condition (aka test) is evaluated.

`continue` – ends the current iteration of the loop and program control goes to the end of the loop body.

for vs. while loops – continue

```
int i = 0, sum = 0;
while (i < 4) {
    if (i % 3 == 0)
        continue;
    sum += i;
    i++;
}

System.out.println(sum);
```

// prints: ??

continue – ends the current iteration of the loop and program control goes to the end of the loop body.

for vs. while loops – continue

```
int i = 0, sum = 0;
while (i < 4) {
    if (i % 3 == 0)
        continue;
    sum += i;
    i++;
}

System.out.println(sum);
```

// prints: ??

```
int i = 0, sum = 0;
while (i < 4) {
    if (i % 3 == 0) {
        i++;
        continue;
    }
    sum += i;
    i++;
}

System.out.println(sum);
```

// prints: 3

continue – ends the current iteration of the loop and program control goes to the end of the loop body.
